

Facility Update

Facility 11/4/08

The photo depicts construction at DeShazo Elementary. The contractor should begin pouring the concrete for the slab today or tomorrow. You should see steel going up fairly soon after that.

The High School is also progressing—it's just harder to see the progress. They are drilling piers (over 100 of them) for the foundation. Some of them are over 25 feet deep! It is so sandy in that area that they must drill them that deep to make sure the foundation is solid. When the original High School was built in 1949-1950, the contractors also dug them about that deep because of the sandy soil.
